

# Integrated observation well network of Geological Survey of Japan, AIST for study of Tonankai and Nankai earthquakes

\*Naoji Koizumi, N.Matsumoto, S.Itaba and R.Ohtani  
(Geological Survey of Japan, AIST)

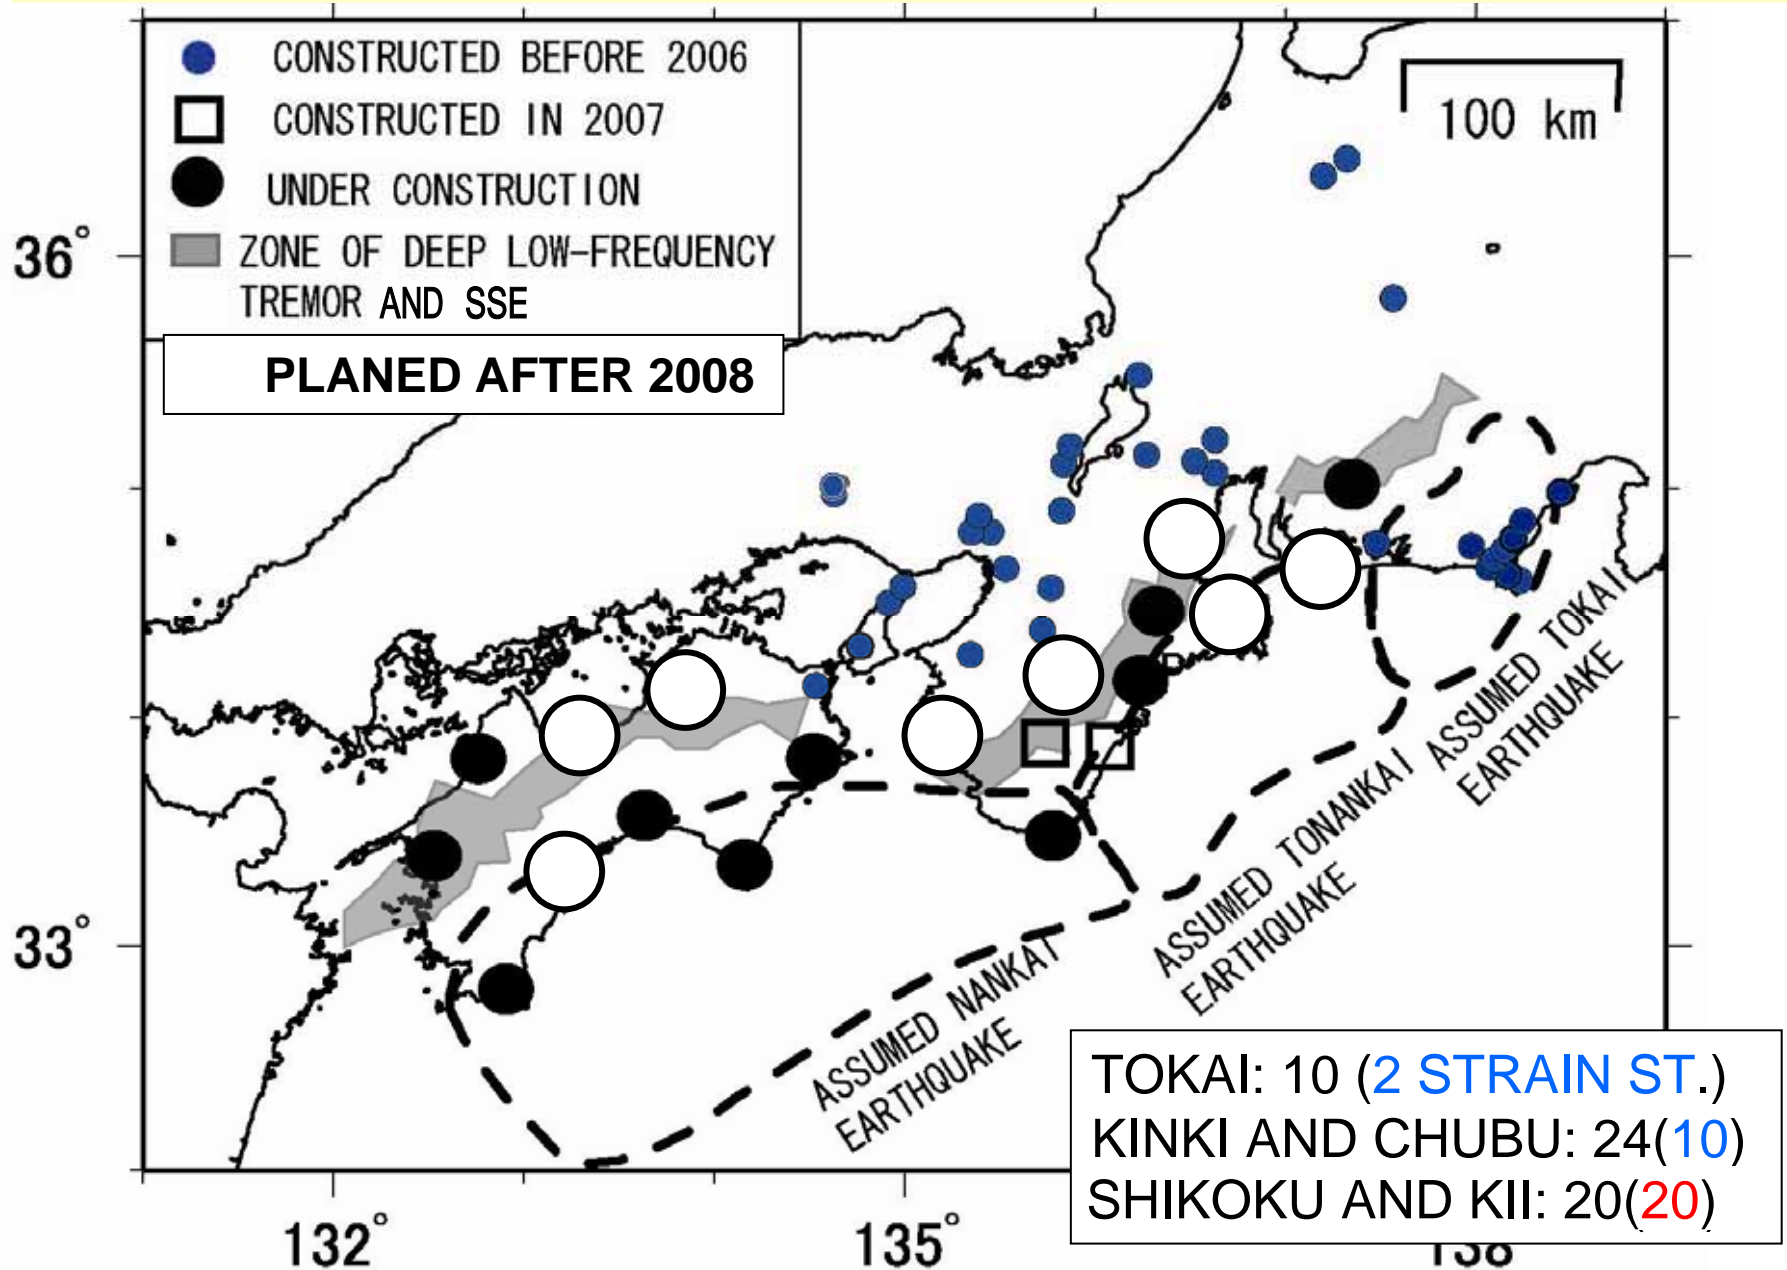

## OVERVIEW

- **20** NEW GROUNDWATER OBSERVATION STATIONS IN AND AROUND **SHIKOKU AND KII PENINSULA, JAPAN.**
- NEW STATIONS + 10 STATIONS IN TOKAI  
WILL MONITOR **SSE(SLOW SLIP EVENT) AND TREMOR IN THE PLATE BOUNDARY**  
**(SSE: SIMILAR TO PRE-SLIP OR POSSIBLE PRECURSOR TO EARTHQUAKE)**
- NEW STATION
  - **3 WELLS** (30m, 200m, 600m), ALL CORING AT THE 600m-WELL
  - OBSERVATION: **GROUNDWATER, CRUSTAL DEFROMATION, SEISMICITY**
  - **REAL-TIME DATA COLLECTION**
  - **HIGH SAMPLING RATE**  
(1Hz: GROUNDWATER OBS., 10-20 Hz: STRAIN AND TILT)

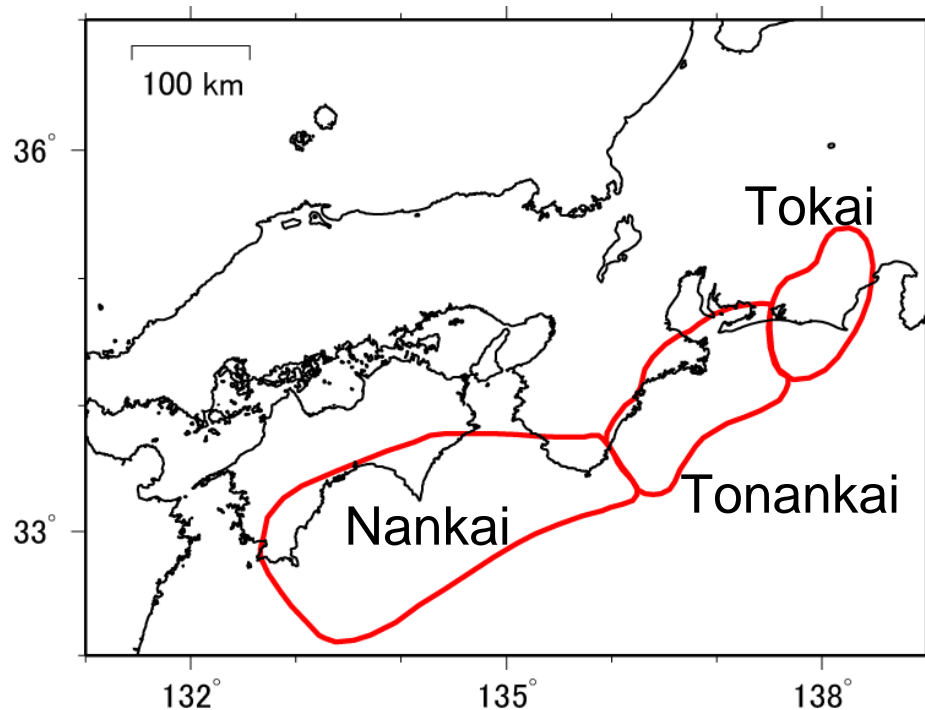

## SCHEDULE

- 2006-2007: **2** STATIONS
- 2007-2008: **10** STATIONS
- **2008- :?**

# GROUNDWATER OBSERVATION NETWORK OF GSJ, AIST

# Nankai, Tonankai and Tokai Earthquakes

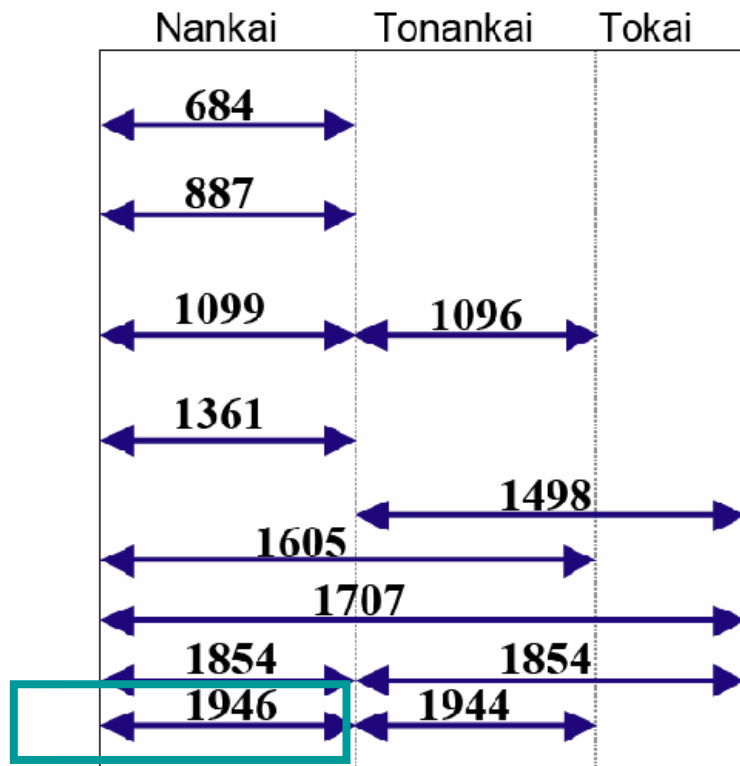

- Nine times by historical documents
- M7.9 – M8.4
- Interval: 90 - 150 years  
(after 1605)

# DECREASE IN GROUNDWATER DISCHARGE OR LEVEL AT HOT SPRINGS ASSOCIATED WITH THE EARTHQUAKES

Dogo

Yunomine

Sangawa (1992)

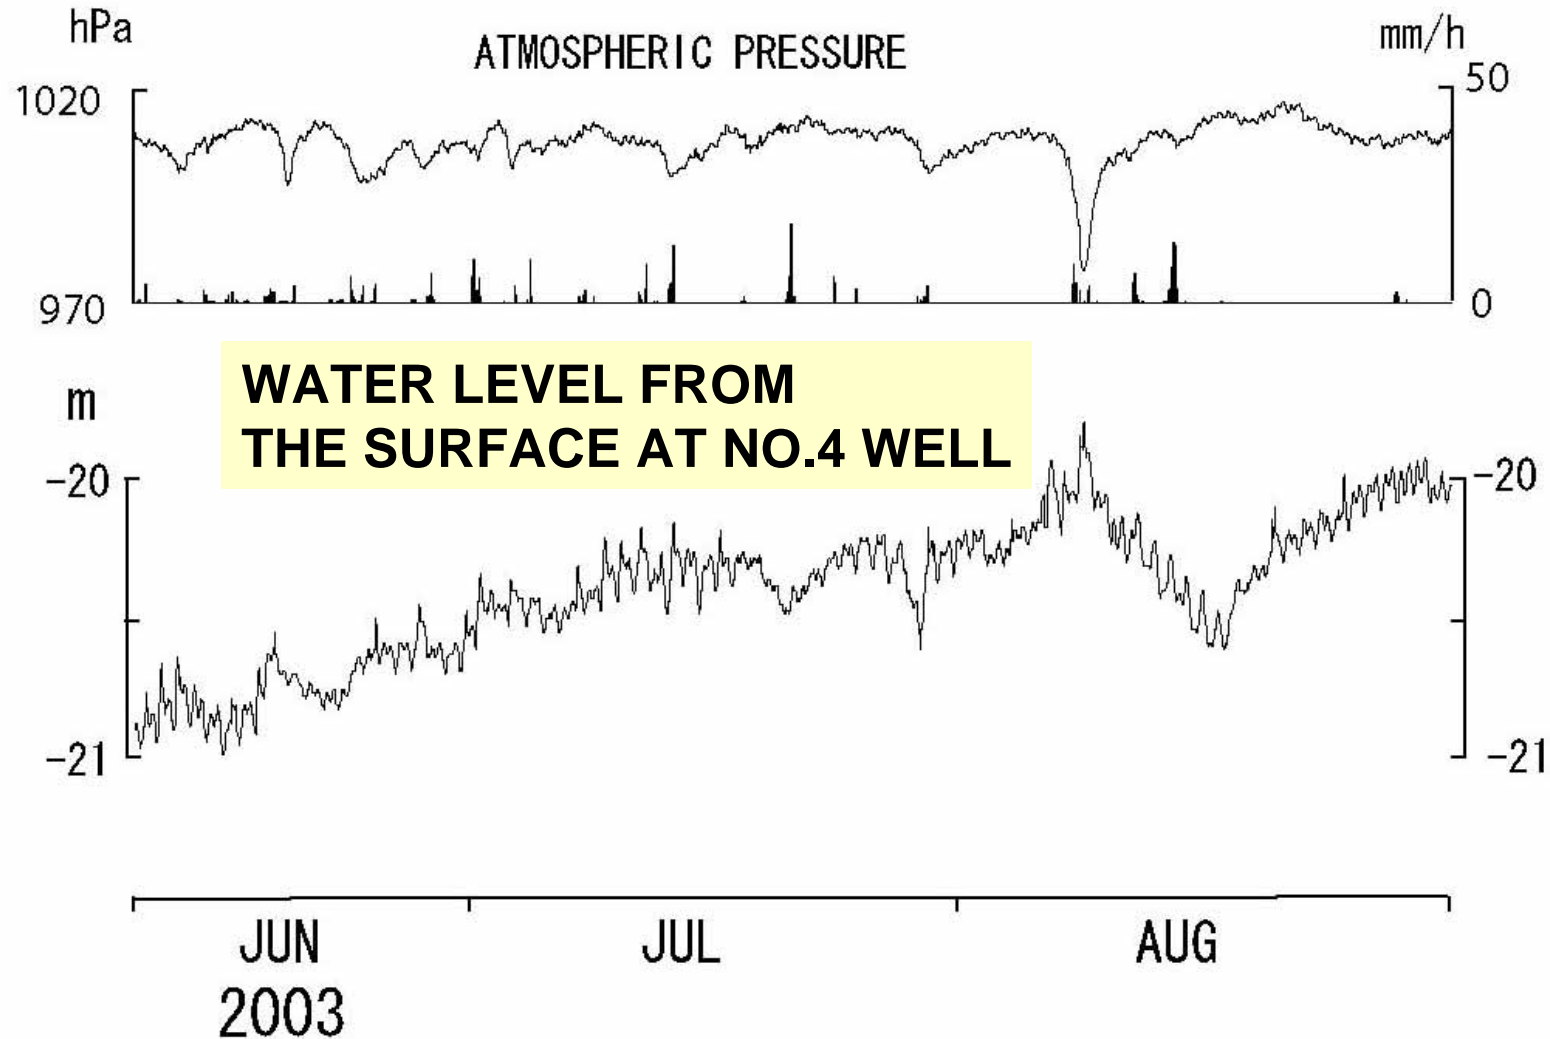

Usami (2003)

**Dogo hot spring:** Groundwater level decreases after the 1946 Nankai earthquake

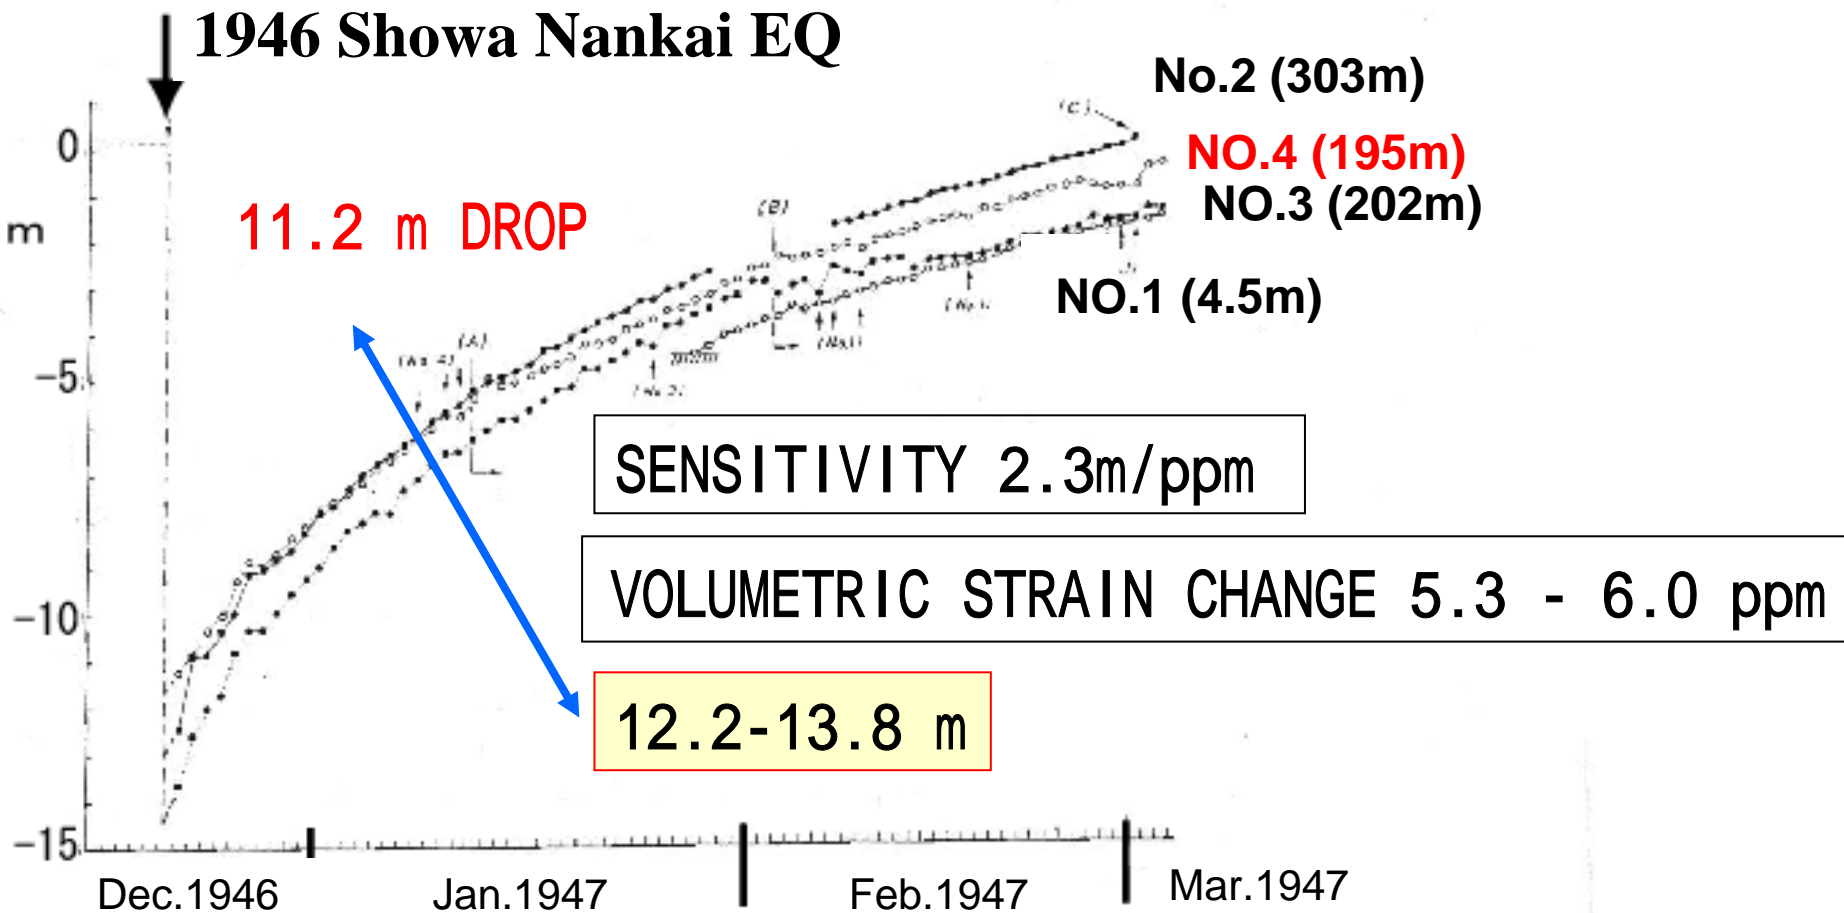

Modified from Kawabe (1991)

# Strain sensitivity estimation using tidal analysis

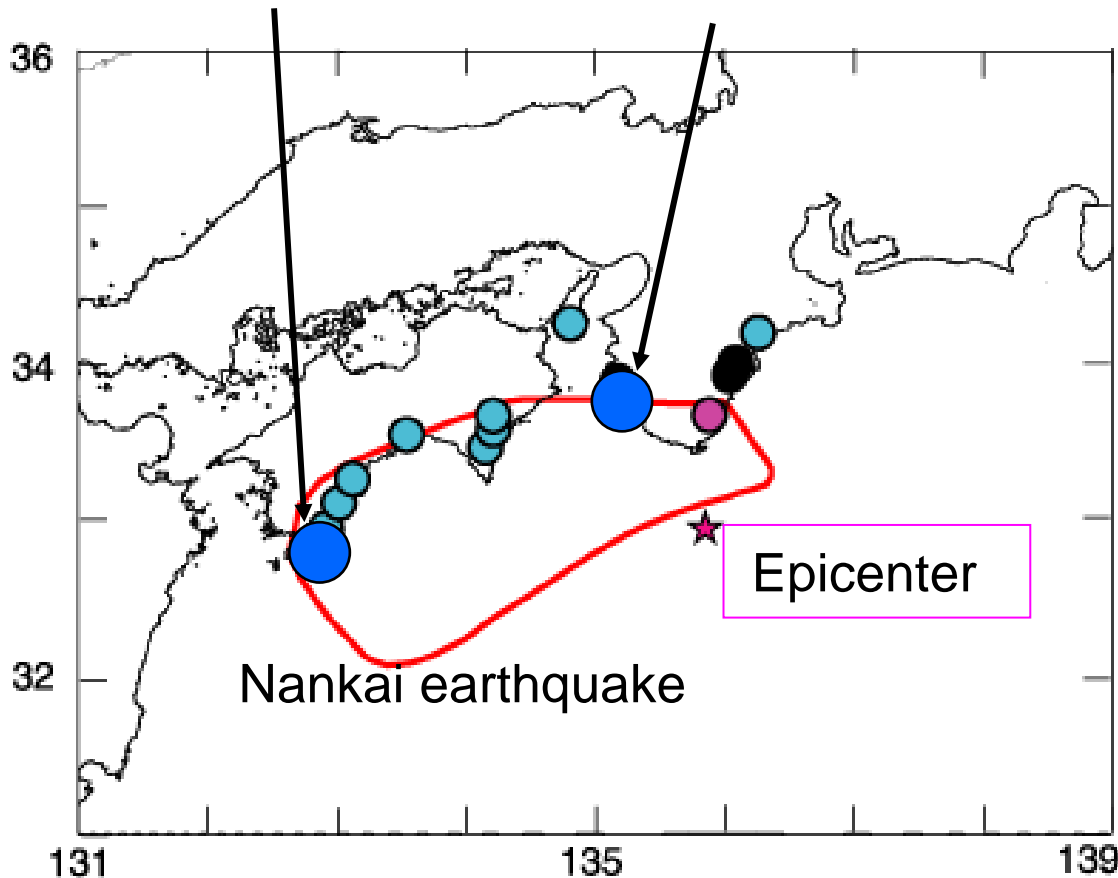

Sensitivity of the water level to vol. strain:  
 $2.3 \text{ mm} / \text{nstrain} = 2.3 \text{ m/ppm}$

**Dogo hot spring:** Groundwater level decreases after the 1946 Nankai earthquake

# Preseismic groundwater anomalies

1-10 days before the 1854 Nankai earthquake

SHIGETOMI ET AL.(2005)

**FEW** ANOMALIES  
OCCURRED IN A  
**WIDE** AREA.

0.5-1m ?

- 11 DROPS in shallow unconfined groundwater level
- 1 Decrease in hot spring water discharge
- Getting turbid

SURVEYD POINTS > 150

3. **DECREASE** IN GRONDWATER  
LEVEL OR DISCHARGE

2. RISE

NANKAI TROUGH

2. EXTENSION

EURASIAN  
PLATE

1. SLIP

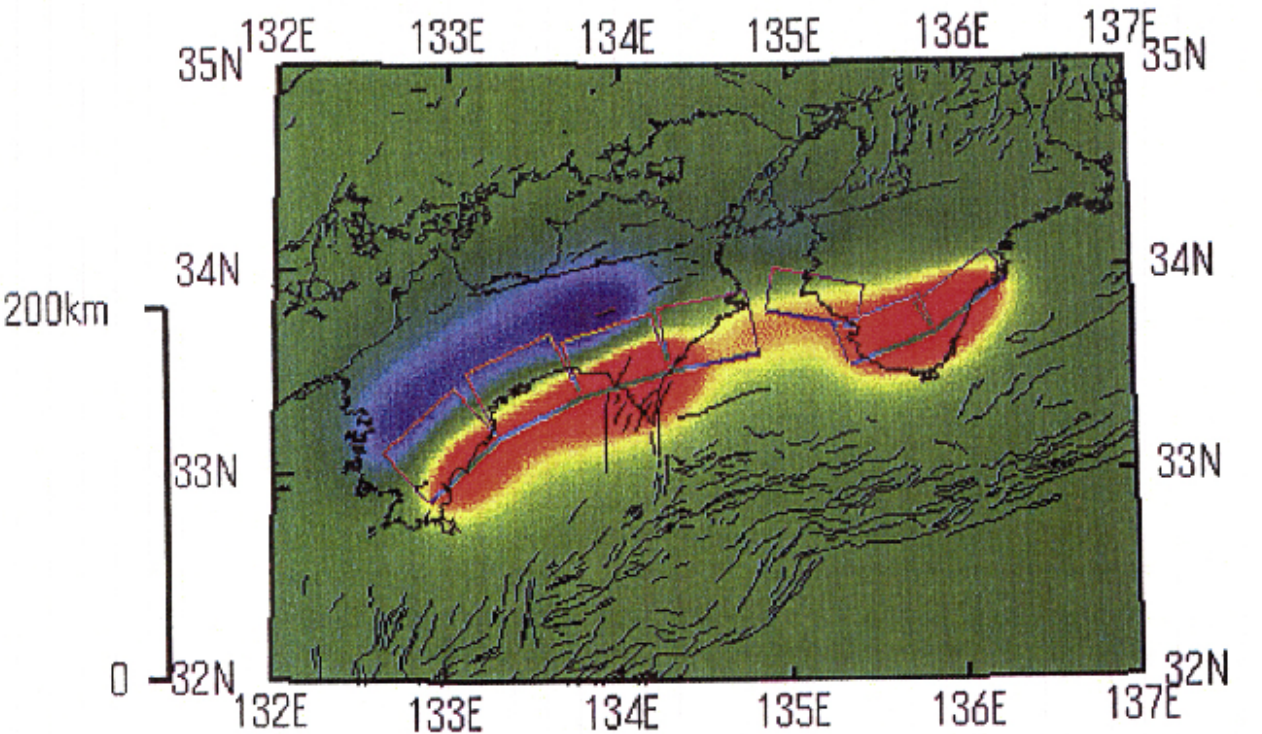

PHILIPPINE SEA PLATE

Ito et al.(2007)

PRESEISMIC VERTICAL MOVEMENTS AT THE SURFACE  
EXPECTED FROM A PRE-SLIP MODEL FOR  
THE 1946 NANKAI EARTHQUAKE

UNCONFINED  
GROUNDWATER  
LEVEL CHANGE

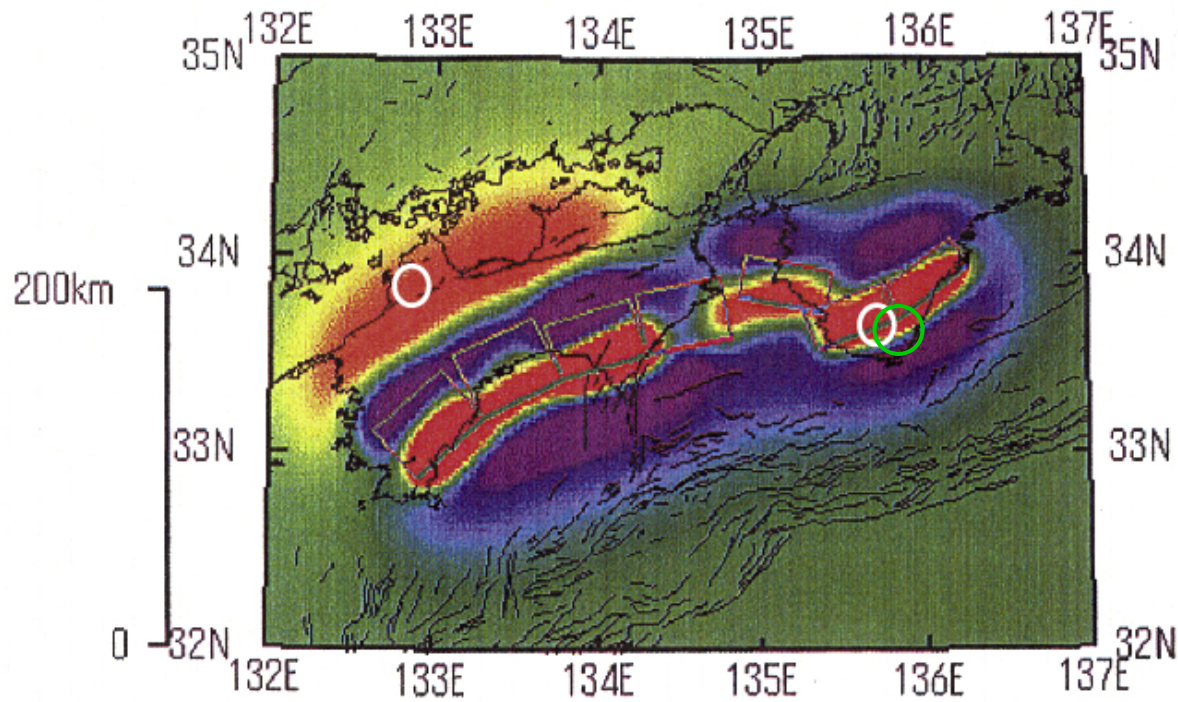

MODIFIED FROM HASHIMOTO (2003)

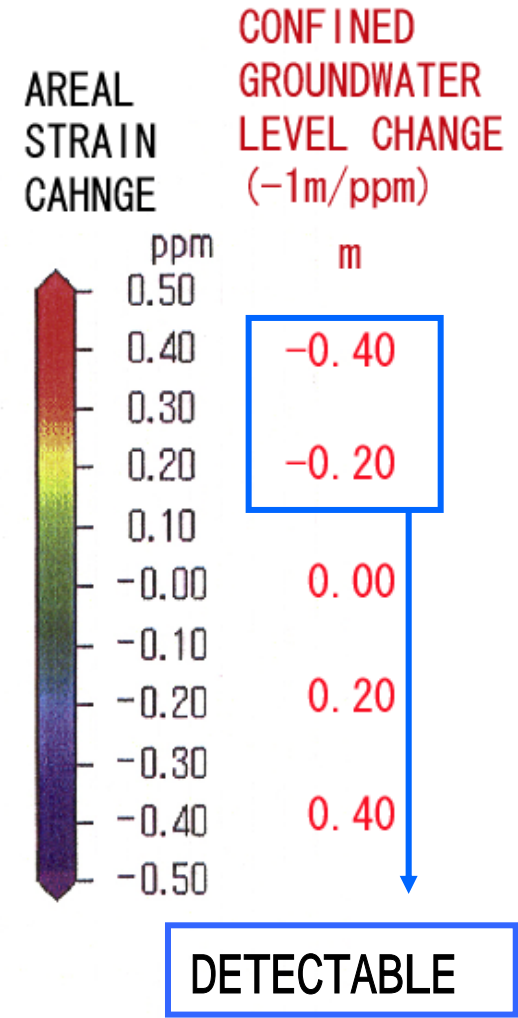

TOO SMALL !!

PRESEISMIC AREAL STRAIN CHANGES  
 EXPECTED FROM A PRE-SLIP MODEL FOR  
 THE 1946 NANKAI EARTHQUAKE

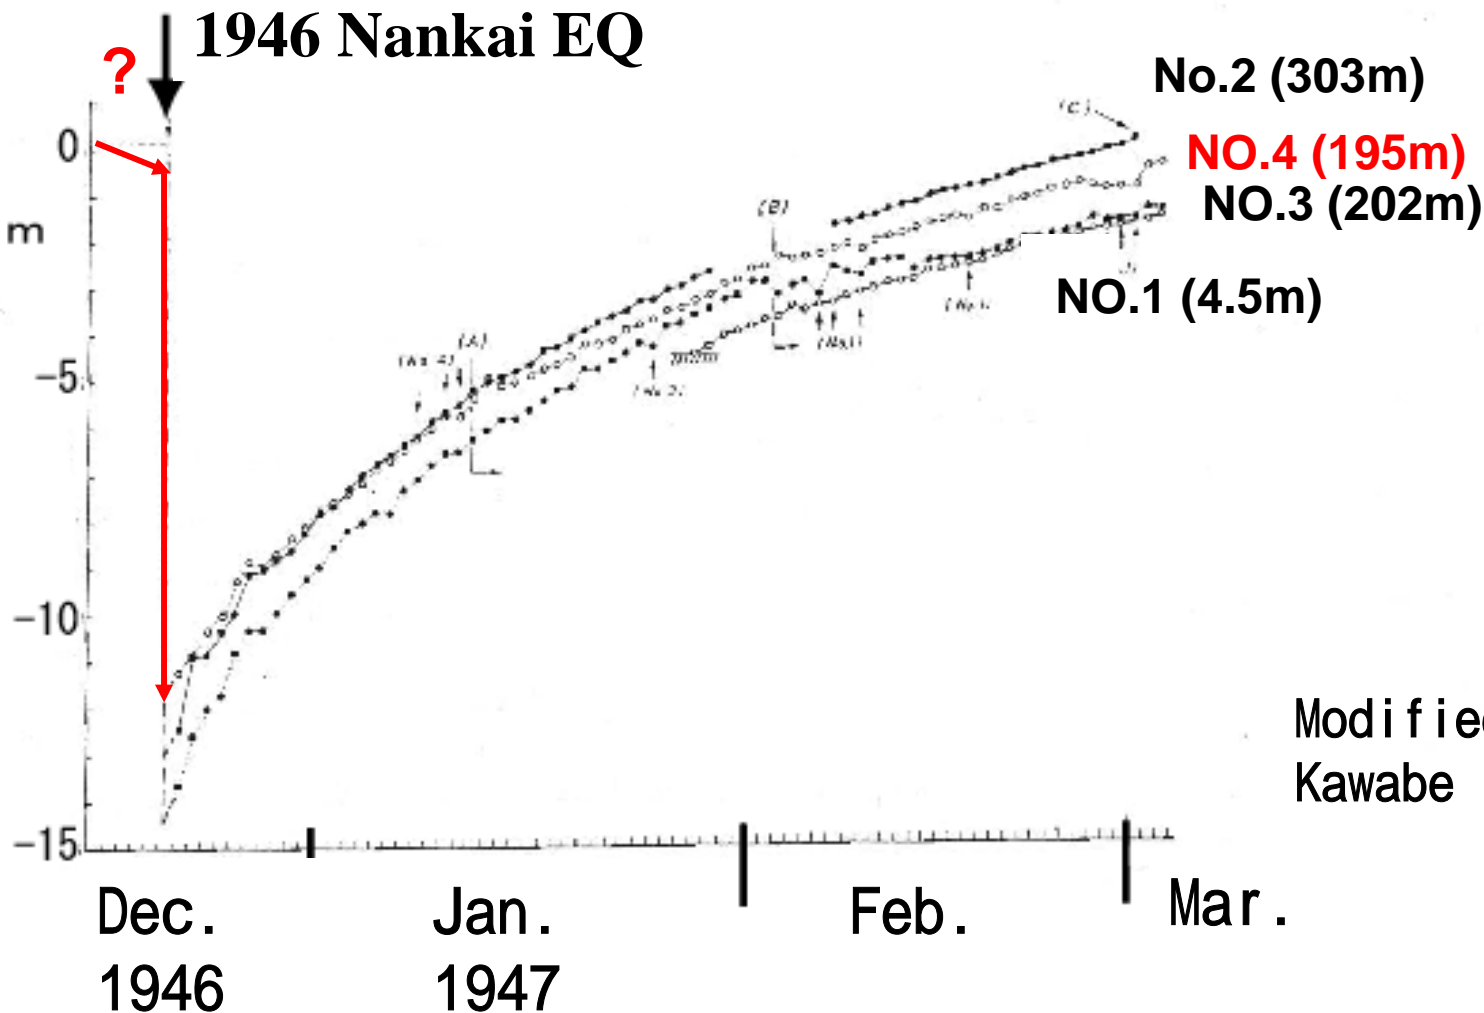

MODIFIED FROM HASHIMOTO (2003)

**Dogo hot spring:** Groundwater level decreases after the 1946 Nankai earthquake

Modified from Kawabe (1991)

# SHALLOW UNCONFINED GROUNDWATER: MODEL-1

SHALLOW UNCONFINED GROUNDWATER:  
MODEL 2

WIDE AREA

PRESEISMIC CRUSTAL DEFORMATION INDUCED BY PRESLIP

+ FLOW FROM UNCONFINED GROUNDWATER  
TO CONFINED GROUNDWATER ?

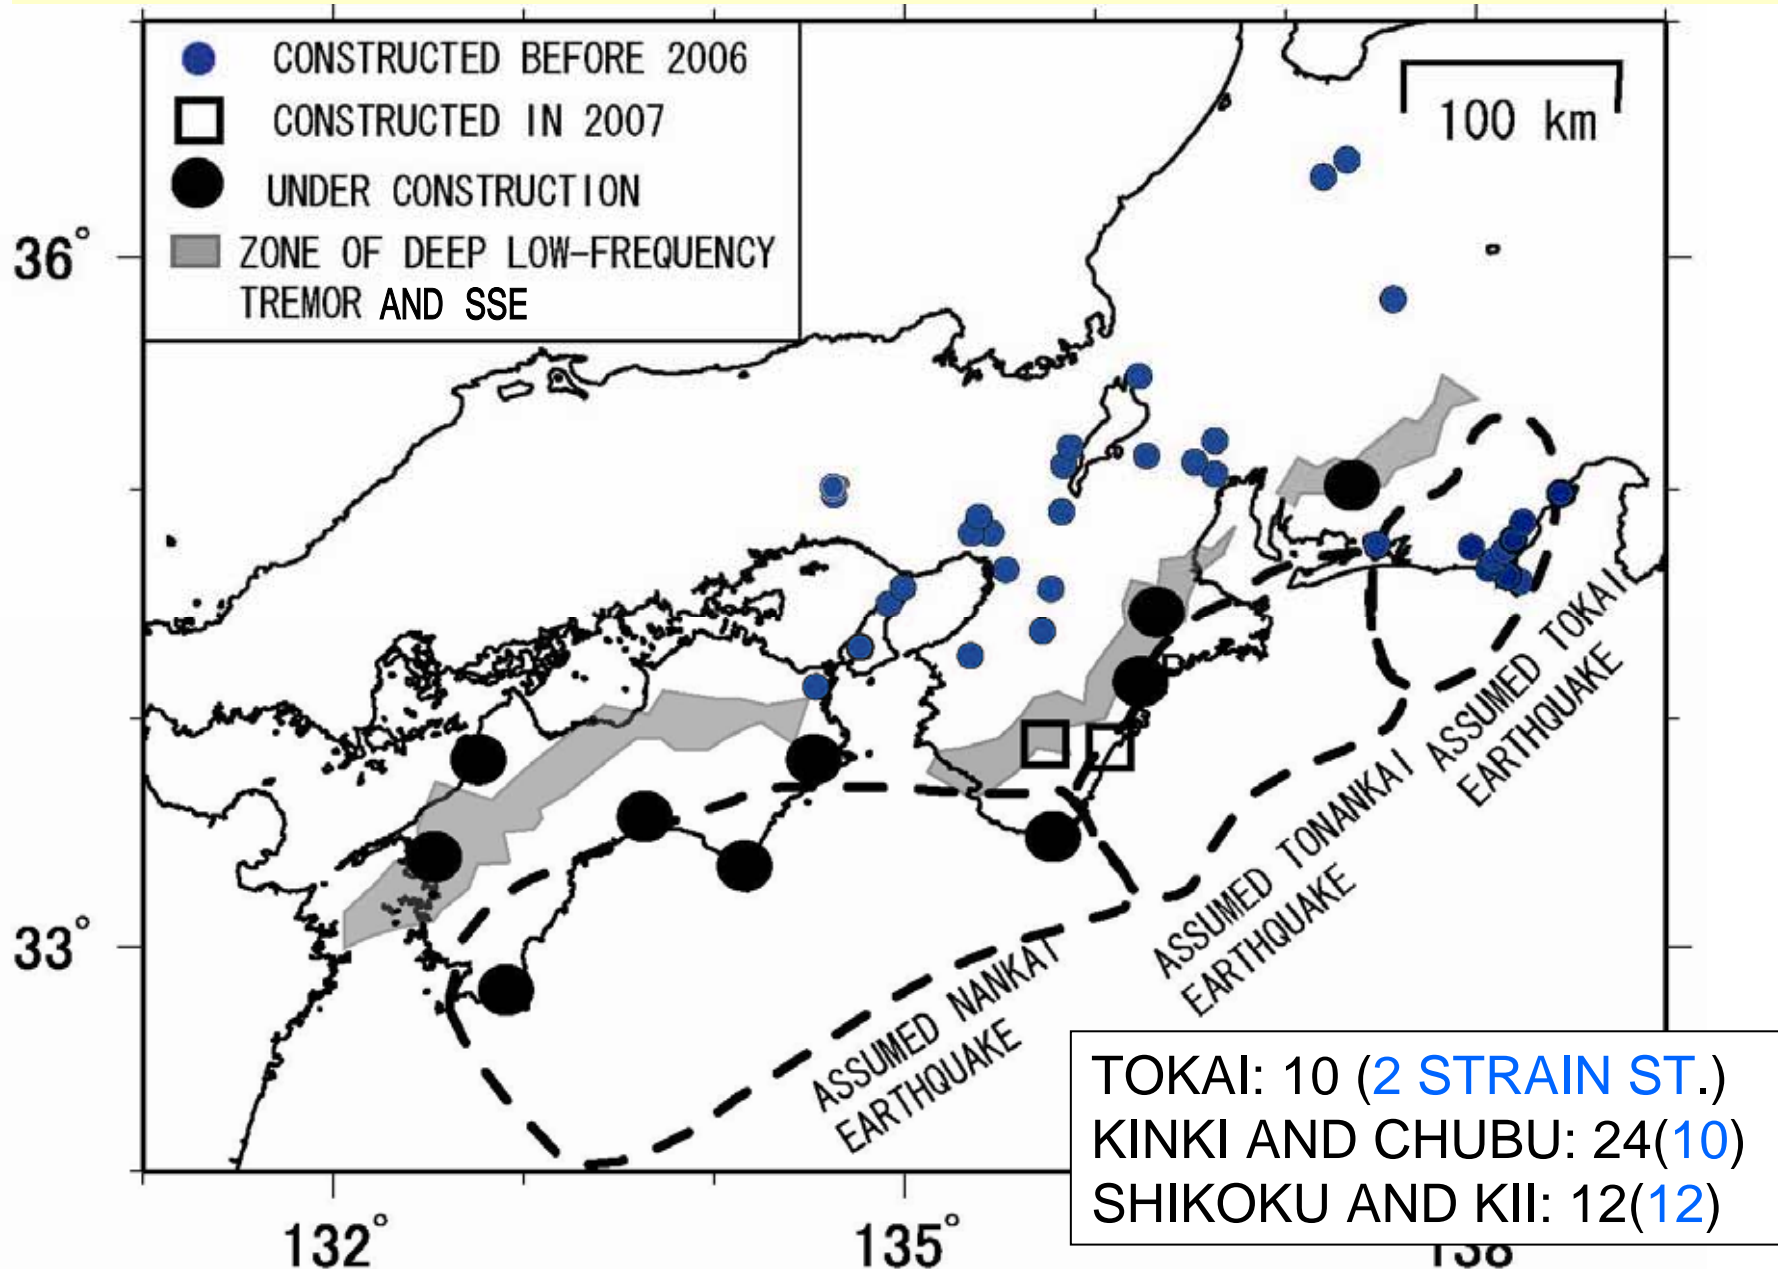

# NEW OBSERVATION STATION

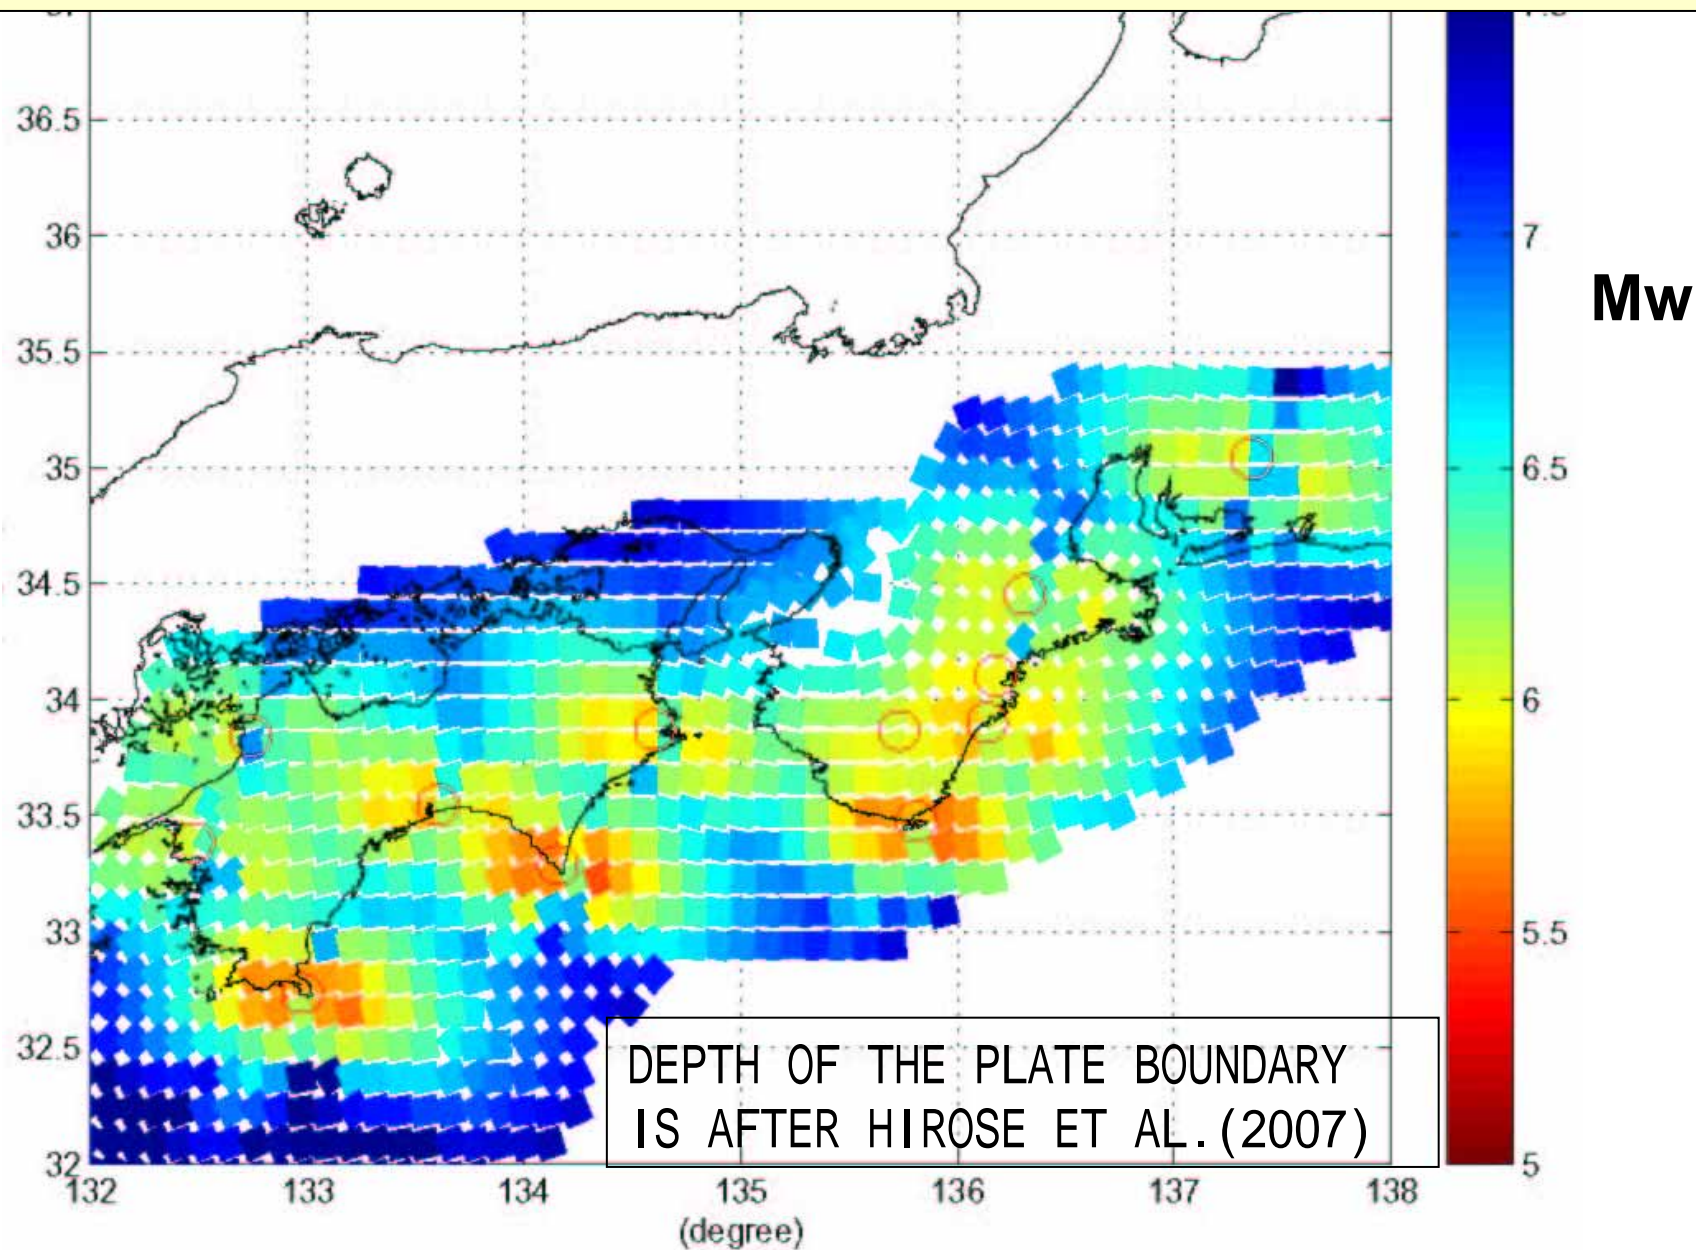

# GROUNDWATER OBSERVATION NETWORK OF GSJ, AIST

DETECTABLE MINIMUM SLIP ON THE PLATE BOUNDARY WHICH  
CAUSES STRAIN OF 0.02 PPM ON THE SURFACE BY 12 STATIONS

# CONCLUSIONS

## GSJ, AIST IS CONSTRUCTING THE INTEGRATED OBSERVATION NETWORK

- To detect and confirm the preslip for gigantic earthquakes in Nankai and Suruga troughs,
- To monitor SSE precisely to clarify the mechanism of SSE and develop the preslip model,
- To know whether groundwater amplifies small crustal deformation related to slow slip in the plate boundary.

Thank you for your  
interest.
